# 服务器端搭建

SSM框架: Spring+SpringMVC+MyBatis SpringBoot工具

创建所有项目都是基于maven创建。 maven项目管理(清理-编译-测试-打包-部署)和依赖(jar)管理的工具。

解压maven

```
D:\tools\apache-maven-3.8.8
```

配置maven

打开D:\tools\apache-maven-3.8.8\conf\settings.xml

maven集成Idea

pom.xml

```
<?xml version="1.0" encoding="UTF-8"?>
project xmlns="http://maven.apache.org/POM/4.0.0"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
       xsi:schemaLocation="http://maven.apache.org/POM/4.0.0"
https://maven.apache.org/xsd/maven-4.0.0.xsd">
   <modelversion>4.0.0</modelversion>
   <!-- 当前项目坐标 -->
   <groupId>com.haiyang
   <artifactId>mall-server-021</artifactId>
   <version>1.0.0
   <packaging>jar</packaging>
   <!-- 运行参数 -->
   cproperties>
       <java.version>1.8</java.version>
       oject.reporting.outputEncoding>UTF-8/project.reporting.outputEncoding>
       <!-- springboot版本 -->
       <spring-boot.version>2.3.7.RELEASE</spring-boot.version>
   </properties>
   <!-- 依赖 -->
   <dependencies>
       <dependency>
          <groupId>org.springframework.boot
```

```
<artifactId>spring-boot-starter-web</artifactId>
       </dependency>
       <!-- MySQL数据库驱动-->
       <dependency>
           <groupId>mysql</groupId>
           <artifactId>mysql-connector-java</artifactId>
           <scope>runtime</scope>
       </dependency>
       <!-- lombok插件-->
       <dependency>
           <groupId>org.projectlombok</groupId>
           <artifactId>lombok</artifactId>
           <optional>true</optional>
       </dependency>
       <dependency>
           <groupId>org.springframework.boot</groupId>
           <artifactId>spring-boot-starter-test</artifactId>
           <scope>test</scope>
           <exclusions>
               <exclusion>
                   <groupId>org.junit.vintage
                   <artifactId>junit-vintage-engine</artifactId>
               </exclusion>
           </exclusions>
       </dependency>
   </dependencies>
   <dependencyManagement>
       <dependencies>
           <dependency>
               <groupId>org.springframework.boot
               <artifactId>spring-boot-dependencies</artifactId>
               <version>${spring-boot.version}</version>
               <type>pom</type>
               <scope>import</scope>
           </dependency>
       </dependencies>
   </dependencyManagement>
   <build>
       <plugins>
           <plugin>
               <groupId>org.apache.maven.plugins
               <artifactId>maven-compiler-plugin</artifactId>
               <version>3.8.1
               <configuration>
                   <source>1.8</source>
                   <target>1.8</target>
                   <encoding>UTF-8</encoding>
               </configuration>
           </plugin>
           <plugin>
               <groupId>org.springframework.boot
               <artifactId>spring-boot-maven-plugin</artifactId>
               <version>2.3.7.RELEASE
           </plugin>
       </plugins>
   </build>
</project>
```

```
server:
  port: 10001
  servlet:
    context-path: /
```

```
注意:
    yaml文件配置属性节点层次必须对其。
    属性值前面必须有一个空格

项目启动,浏览器访问:
http://localhost:10001/index

如果设置 context-path: /api
http://localhost:10001/api/index
```

### 启动类

包:包名全部小写。包是分层级。

```
例如: com.haiyang
对应物理磁盘上就是文件夹。
包名--域名倒置 cctv.com baidu.com
```

#### 分层开发:

```
      Vue界面
      |

      控制层:
      处理前端发来的请求.
      Vue请求(登录)。 com.haiyang.controller

      |
      业务逻辑层 项目具体功能和流程 登录方法 com.haiyang.service

      |
      数据访问层:
      对数据库CRUD操作 com.haiyang.mapper

      |
      MySQL
```

```
package com.haiyang;
import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@springBootApplication
public class MallServer021Application {
   public static void main(String[] args) {
        SpringApplication.run(MallServer021Application.class, args);
   }
}
```

#### 创建IndexController控制器

```
package com.haiyang.controller;
import org.springframework.web.bind.annotation.RequestMapping;
import org.springframework.web.bind.annotation.RestController;

@RestController //当前类是一个控制器
@RequestMapping("/index")
public class IndexController {
```

```
//处理请求方法
//方法返回数据 就是响应给前端的数据
@RequestMapping("/test")
public String test(){
    return "Hello SpringBoot";
}
```

## 实体类

封装数据:

```
---实体类代码结构---
私有变量 -- 映射表中字段
无参构造方法
变量set和get方法
```

```
package com.haiyang.entity;
import lombok.Data;

@Data
public class Account {
    private String accountId;
    private String password;
    private String accountName;
}
```

# 代码逆向生成

```
<dependency>
    <groupId>mysql</groupId>
    <artifactId>mysql-connector-java</artifactId>
    <version>5.1.49</version>
</dependency>
```

### 编写控制器的父类

```
package com.haiyang.common;
//控制器的父类
public class BaseController {
}
```

```
package com.haiyang.common;
import com.baomidou.mybatisplus.annotation.TableField;
import java.time.LocalDateTime;
public class BaseEntity {
   /**
    * 创建时间
    */
   @TableField("created")
   private LocalDateTime created;
    /**
    * 修改时间
    */
   @TableField("updated")
   private LocalDateTime updated;
   @TableField("statu")
   private Integer statu;
}
```

### 配置mybatis-plus框架

导入mybatisPlus逆向代码生成的相关jar包,修改pom.xml

```
<!-- mybatis-plus -->
<dependency>
   <groupId>com.baomidou
   <artifactId>mybatis-plus-boot-starter</artifactId>
   <version>3.4.2
</dependency>
<!-- 代码生成器 -->
<dependency>
   <groupId>com.baomidou
   <artifactId>mybatis-plus-generator</artifactId>
   <version>3.4.1
</dependency>
<!-- 代码自动生成器模板依赖-->
<dependency>
   <groupId>org.apache.velocity
   <artifactId>velocity-engine-core</artifactId>
   <version>2.2</version>
</dependency>
<dependency>
   <groupId>org.springframework.boot</groupId>
   <artifactId>spring-boot-starter-freemarker</artifactId>
</dependency>
```

```
spring:
   datasource:
        driver-class-name: com.mysql.cj.jdbc.Driver
        url: jdbc:mysql://localhost:3306/system?useUnicode=true&characterEncoding=utf-
8&useSSL=false&serverTimezone=GMT%2B8
        username: root
        password: root
```

#### 修改CategroyMapper接口

```
加上@Mapper
package com.haiyang.mapper;
import com.haiyang.entity.Category;
import com.baomidou.mybatisplus.core.mapper.BaseMapper;
import org.apache.ibatis.annotations.Mapper;

@Mapper
public interface CategoryMapper extends BaseMapper<Category> {
}
```

### 编写CategoryController中测试方法

```
package com.haiyang.controller;
import com.haiyang.entity.Category;
import com.haiyang.service.CategoryService;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.web.bind.annotation.RequestMapping;
import org.springframework.web.bind.annotation.RestController;
import com.haiyang.common.BaseController;
import java.util.List;
@RestController
@RequestMapping("/category")
public class CategoryController extends BaseController {
   //需要创建CategoryService对象
   //@Autowired Spring框架自动创建好该对象
   @Autowired
   private CategoryService cService;
   //处理 前端请求所有商家分类的请求
   @RequestMapping("/list")
   public List<Category> list(){
       //获得所有的商家分类数据 sys_category表中数据
       //返回 List<Category>
       return cService.list();
   }
}
```

访问地址:http://localhost:10001/category/list
